1 Wave propagation below cutoff

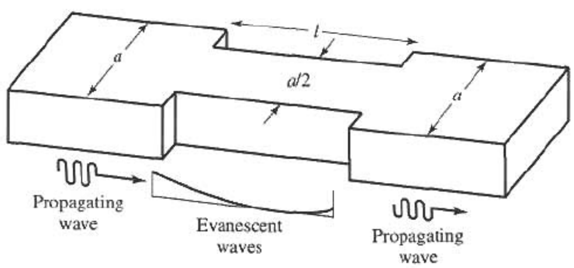
Consider propagation inside a waveguide in a non-TEM mode below cutoff. Compute the normalized cutoff k_c/k such that a wave suffers an attenuation of 30dB per meter in such a waveguide as it propagates.

2 Pozar, 3.4

Compute the TE_{10} mode attenuation, in dB/m, for a K-band rectangular waveguide operating at f=20 GHz (see physical characteristics in the appencices below). The waveguide is made from brass, and is filled with a dielectric material having $\epsilon_r = 2.2$ and $\tan\delta = 0.002$.

3 Pozar, 3.5

An attenuator can be made using a section of waveguide operating below cutoff, as shown below. If $a = 2.286cm$ and the operating frequency is 12 GHz, determine the required length of the below-cutoff section of waveguide to achieve an attenuation of 100 dB between the input and output guides. Ignore the effect of reflections at the step discontinuities.



4 Pozar, 3.6

Using the fact hat $\mathbf{J} = \hat{n} \times \mathbf{H}$, find expressions for the electric surface current density on the walls of a rectangular waveguide for a TE_{10} mode. Why can a narrow slot be cut along the centerline of the broad wall of a rectangular waveguide without perturbing the operation of the guide? (Such a slot is often used in a slotted line for a probe to sample the standing wave field inside the guide.)

5 Pozar example 2.7, exercises 2.28 & 3.28

This exercise deals with a circular coaxial line with radii a and b (internal and external respectively) operating in the TEM mode.

1. Show that attenuation constant due to finite conductivity is given by:
   $\alpha_c = \frac{R_s}{2\eta \ln(b/a)} \left(\frac{1}{a} + \frac{1}{b}\right)$
2. Compute the ratio of the radii that minimizes the above constant and compute the corresponding transmission line impedance for air filling.

3. Considering the fundamental (TEM) mode, show that the maximum power that can be handled by the guide, if the electric field intensity can be at most E_d to avoid dielectric breakdown of the filling material, is:

   $P_{max} = \frac{\pi a^2 E_d^2}{\eta} \ln \frac{b}{a}$

4. Compute the ratio of the radii that maximizes the power handling capability and the corresponding transmission line impedance for air filling.

6 Pozar 3.20

Design a microstrip transmission line for a 100Ω characteristic impedance.The substrate thickness is 0.158 cm, with $\epsilon_r = 2.20$. What is the guided wavelength on this transmission line if the frequency is 4.0 GHz?

7 Pozar 3.21

A 100Ω microstrip line is printed on a substrate of thickness 0.0762cm, with a dielectric constant of 2.2. Ignoring losses and fringing fields, find the shortest length of this line that appears at its input as a capacitor of 5 pF at 2.5 GHz. Repeat for an inductance of 5 nH. Using a microwave CAD package with a physical model for the microstrip line, compute the actual input impedance seen when losses are included (assume copper conductors and $\tan\delta = 0.001$).

8 Pozar 3.22

A microwave antenna feed network operating at 5 GHz requires a 50Ω printed transmission line that is 16λ long. Possible choices are (1) copper microstrip, with d=0.16cm, $\epsilon_r = 2.20$ and $\tan\delta = 0.001$, or (2) copper stripline, with b=0.32 cm, ϵ_r =2.2O, t=0.01 mm, and $\tan\delta$=0.001. Which line should be used, if attenuation is to be minimized?

APPENDIX C BESSEL FUNCTIONS

Bessel functions are solutions to the differential equation,

$$\frac{1}{\rho}\frac{d}{d\rho}\left(\rho\frac{df}{d\rho}\right) + \left(k^2 - \frac{n^2}{\rho^2}\right)f = 0 \qquad \text{(C.1)}$$

where k^2 is real and n is an integer. The two independent solutions to this equation are called ordinary Bessel functions of the first and second kind, written as $J_n(k\rho)$ and $Y_n(k\rho)$, and so the general solution to (C.1) is

$$f(\rho) = AJ_n(k\rho) + BY_n(k\rho) \qquad \text{(C.2)}$$

where A and B are arbitrary constants to be determined from boundary conditions.

These functions can be written in series form as

$$J_n(x) = \sum_{m=0}^{\infty}\frac{(-1)^m(x/2)^{n+2m}}{m!(n+m)!} \qquad \text{(C.3)}$$

$$Y_n(x) = \frac{2}{\pi}\left(\gamma + \ln\frac{x}{2}\right)J_n(x) - \frac{1}{\pi}\sum_{m=0}^{n-1}\frac{(n-m-1)!}{m!}\left(\frac{2}{x}\right)^{n-2m} - \frac{1}{\pi}\sum_{m=0}^{\infty}\frac{(-1)^m(x/2)^{n+2m}}{m!(n+m)!}$$
$$\times\left(1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{m} + 1 + \frac{1}{2} + \cdots + \frac{1}{n+m}\right) \qquad \text{(C.4)}$$

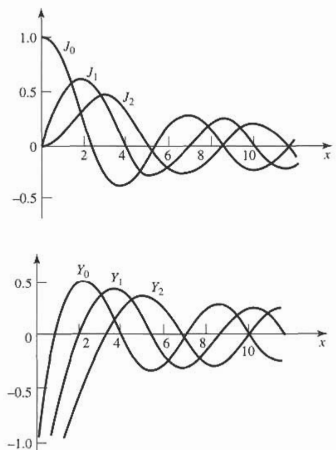

FIGURE C.1 Bessel functions of the first and second kind.

where $\gamma = 0.5772\ldots$ is Euler's constant, and $x = k\rho$. Note that Y_n becomes infinite at $x = 0$, due to the ln term. From these series expressions, small argument formulas can be obtained as

$$J_n(x) \sim \frac{1}{n!}\left(\frac{x}{2}\right)^n \tag{C.5}$$

$$Y_0(x) \sim \frac{2}{\pi}\ln x \tag{C.6}$$

$$Y_n(x) \sim \frac{-1}{\pi}(n-1)!\left(\frac{2}{x}\right)^n, \qquad n > 0 \tag{C.7}$$

Large argument formulas can be derived as

$$J_n(x) \sim \sqrt{\frac{2}{\pi x}}\cos\left(x - \frac{\pi}{4} - \frac{n\pi}{2}\right) \tag{C.8}$$

$$Y_n(x) \sim \sqrt{\frac{2}{\pi x}}\sin\left(x - \frac{\pi}{4} - \frac{n\pi}{2}\right) \tag{C.9}$$

Figure C.1 shows graphs of a few of the lowest order Bessel functions of each type.

Recurrence formulas relate Bessel functions of different orders:

$$Z_{n+1}(x) = \frac{2n}{x}Z_n(x) - Z_{n-1}(x) \tag{C.10}$$

$$Z_n'(x) = \frac{-n}{x}Z_n(x) + Z_{n-1}(x) \tag{C.11}$$

$$Z_n'(x) = \frac{n}{x}Z_n(x) - Z_{n+1}(x) \tag{C.12}$$

$$Z_n'(x) = \frac{1}{2}[Z_{n-1}(x) - Z_{n+1}(x)] \tag{C.13}$$

where $Z_n = J_n$ or Y_n. The following integral relations involving Bessel functions are useful:

$$\int_0^x Z_m^2(kx)x\,dx = \frac{x^2}{2}\left[Z_n'^2(kx) + \left(1 - \frac{n^2}{k^2x^2}\right)Z_n^2(kx)\right] \tag{C.14}$$

$$\int_0^x Z_n(kx)Z_n(\ell x)x\,dx = \frac{x}{k^2-\ell^2}[kZ_n(\ell x)Z_{n+1}(kx) - \ell Z_n(kx)Z_{n+1}(\ell x)] \tag{C.15}$$

$$\int_0^{p_{nm}}\left[J_n'^2(x) + \frac{n^2}{x^2}J_n^2(x)\right]x\,dx = \frac{p_{nm}^2}{2}J_n'^2(p_{nm}) \tag{C.16}$$

$$\int_0^{p'_{nm}}\left[J_n'^2(x) + \frac{n^2}{x^2}J_n^2(x)\right]x\,dx = \frac{(p'_{nm})^2}{2}\left(1 - \frac{n^2}{(p'_{nm})^2}\right)J_n^2(p'_{nm}) \tag{C.17}$$

where $J_n(p_{nm}) = 0$, and $J_n'(p'_{nm}) = 0$. The zeros of $J_n(x)$ and $J_n'(x)$ are on the following two pages.
